GHOST GALAXIES

John Kormendy
Institute for Astronomy, University of Hawaii

and

Kenneth Freeman
Mount Stromlo Observatory

The smallest galaxies known are more than 99 % dark matter:
they look gossamer because they contain few stars,
but they are dense balls of dark matter.

There may be a large population of dwarf galaxies that are
still darker – that contain too few stars to be discovered.
They may outnumber all luminous galaxies combined.
